

IMPROVING IVF SUCCESS

AI and robotics-based
autonomous sperm selection
for IVF

Company Presentation

October 2023

Vision & Mission

Vision

To harness cutting-edge technologies to allow more people to have healthy BAIBYS™.

Mission

To leverage artificial intelligence, big data, micro-robotics, and automation to improve male fertility by revolutionizing Assisted Reproductive Technology (ART).

AI-based autonomous robotic system for selecting optimal sperm cells for IVF

BAIBYS™ develops an AI and robotics-based COMPLETELY AUTONOMOUS system for sperm selection at high magnification for ICSI (including the physical pick-up and isolation of the optimal cells), which will **improve success rates**, **reduce birth defects**, and **raise clinics' throughput**.

Fertility Crisis

Global Fertility Crisis Around Us

The New York Times

Opinion

What Are Sperm Telling Us?

Scientists are concerned by falling sperm counts and declining egg quality. Endocrine-disrupting chemicals may be the problem.

By **Nicholas Kristof**
Opinion Columnist

NEWS

Feb. 20, 2021

Add falling sperm counts to the list of threats to human survival, epidemiologist warns

Grace Hauck USA TODAY

Published 4:58 p.m. ET Feb. 27, 2021 | Updated 12:12 p.m. ET Mar. 1, 2021

By **Katherine Latham** 28th March 2023

BBC

Sperm quality appears to be declining around the world but is a little discussed cause of infertility. Now scientists are narrowing in on what might be behind the problem.

Male Fertility Drops Dramatically

Sperm count

Decreased by 50% in 50 years and dropping

Sperm morphology

The criterion for “normal morphology” was changed since it became difficult to find “normal” based on the former definition –

Before 2010 – Definition of “normal sperm” was “>**14%** of cells have normal morphology” (WHO 4th Edition)

After 2010 – Definition of “normal sperm” changed to “>**4%** of cells have normal morphology” (WHO 5th Edition)

Women Give Birth Later

IVF success declines with age

In 2016, the U.S. tipping point

More women gave birth in their 30's than their 20's.

IVF is Booming

1 in 6 people globally affected by infertility: WHO

4 April 2023 | News release | Geneva, Switzerland | Reading time: 2 min (617 words)

Large numbers of people are affected by infertility in their lifetime, according to a [report](#) published today by WHO. Around 17.5% of the adult population – roughly 1 in 6 people – experience infertility, showing the urgent need to increase access to affordable, high-quality fertility care for those in need.

Male Infertility is Hot in Academic Conferences

Dr. Anrija Kumar Datta

Conclusions

- ❑ Overall, when data was analysed for women of 'all ages' combined, the live birth rates dropped significantly with the male partner's age ≥ 40 years
- ❑ There is no impact of paternal age on pregnancy outcomes when the female partners are aged < 35 years or when they are aged 40 or over.
- ❑ However, live birth rates drop as the male partners reach 40 when their partners are aged between 35-39 years.
- ❑ Our findings suggest the effect of female age seems to dominant over male age when they are under 35 and over 40.

IVF's High Personal Toll

**Emotional
roller-coaster**

**Enormous
financial
burden**

**Prolonged and
tedious process
of several years**

Select with care

IVF Evolvement

The Challenge

Classic IVF

Sperm cells compete to fertilize the egg –
Natural selection

Normal birth defects

Low success rate

In ~80% of current IVF –

Random sperm cell is
injected into the egg (ICSI)
to ensure penetration

Higher birth defects

Moderate success rate

Sperm Selection

at High Magnification –

Detailed evaluation of sperm
cell morphology and motility

Normal birth defects

Higher success rate

Manual Sperm Selection at High Magnification

Trained embryologist **manually selects a single sperm** cell out of millions using a special microscope with **high magnification** ($\times 6,100$).

Selection of Spermatozoa with Normal Nuclei to Improve the Pregnancy Rate with Intracytoplasmic Sperm Injection

To the Editor: Intracytoplasmic injection of sperm is the recommended treatment for male infertility, associated with an average pregnancy rate per cycle of about 30 percent. Although sperm count and motility were found to have no effect on the outcome of intracytoplasmic sperm injection, scanning and transmission electron microscopy indicated that the achievement of pregnancy may depend on normal morphology of the sperm nucleus.³

N Engl J Med. Vol. 345. No. 14 · October 4, 2001

Why is High Magnification Critical?

Examining sperm cells at **high magnification shows morphological defects**, which correlate with low success rate and birth defects

At standard magnification no morphological details can be shown

At high magnification morphological defects are clearly shown

**Higher IVF success rate
& lower birth defects**

Why is Morphology Important?

WHO Guidelines (6th Edition, 2021)

“Abnormal spermatozoa generally have a **lower fertilizing potential**, depending on the types of anomalies, and may also have **abnormal DNA**. Morphological defects have been associated with **increased DNA fragmentation**, an **increased incidence of structural chromosomal aberrations**, **immature chromatin** and **aneuploidy**. Emphasis is therefore given to the form of the head, although the sperm tail (midpiece and principal piece) is also important to consider for the understanding of the male reproductive tract”.

Benefits of Sperm Selection

Higher
fertilization rate

Sperm quality
is a critical
factor for embryo
development to
blastocyst stage

Higher pregnancy
and birth rates

Decrease birth
defects

The sperm cell
delivers a novel
epigenetic
signature
to the egg
(Miller et al 2010)

Results According to Injected Sperm

Good sperm cell

Symmetric
Proportional
No morphology defects

Bad sperm cell

Asymmetric
Non-proportional
Has morphological defects (vacuoles)

Good blastocyst

Embryo cells mass
penetrates the blastocell
cavity
Many placenta cells
surround the blastocyst
Distinguished differentiation
between them

Trophoblastoderm
(TE) = Placenta
cells

Inner Cell Mass
(ICM) = Embryo
cells

Bad blastocyst

Little to no embryo cells
mass
Few placenta cells, most
of them atretic

Limitations of Current Technology

BAIBYS' Solution

BAIBYS™ Solution

AI-based autonomous robotic sperm selection platform

Fast

Objective,
consistent, &
more accurate

Fully
automated

Affordable

The smart future of IVF

How Does It Work? AI Classification

AI classifies sperm cells morphology at high magnification

- Proprietary algorithm processes the video stream of “live” sperm in real time
- Autonomously classifies sperm cells based on their morphology & motility at high-magnification ($\times 6,100$)
- The algorithm controls the motorized X-Y stage in real time to maintain the selected sperm cell in the middle of the field of view to allow reviewing the cell from all sides

Watch the video at
youtube.com/watch?v=cRwpi_0r4Tg

How Does It Work? Robotic Selection

Robotic platform scans sperm and extract optimal cells autonomously

- Sub-micrometer motorized X-Y stage
- Intelligent Scanning Technology (IST)
- Controlled micro-manipulator
- Automated isolation of the selected sperm
- Controlled pump extracts cells
- Fully autonomous from A to Z

What does Science Say? ⁽¹⁾

“ *Conclusions: IMSI [a method of sperm selection at high magnification] seems to be **an effective tool at reducing the incidence of structural defects** compared to ICSI...*

Itoi et al, 2021

“ *The **incidence of birth defects** was statistically different, with **2.5% (32/1280) in IMSI and 4.5% (119/2627) in ICSI**. The results demonstrated that IMSI decreased the incidence of structural defects compared to ICSI – 2.2% (18/830) vs. 3.8% (78/2049) – in a statistically significant manner.*

Dieamant et al, 2021

“ *We found a significant **differential DNA methylation and expression of many genes** in sperm with poor and good morphology.*

Cassuto et al, 2021

“ ***Tremendous opportunities exist for machine learning to advance male fertility treatments.** The fundamental challenge of sperm selection — selecting the most promising candidate from 100,000,000 gametes — presents a challenge that is uniquely well-suited to the high-throughput capabilities of machine learning algorithms paired with modern data processing capabilities.*

You et al, 2021

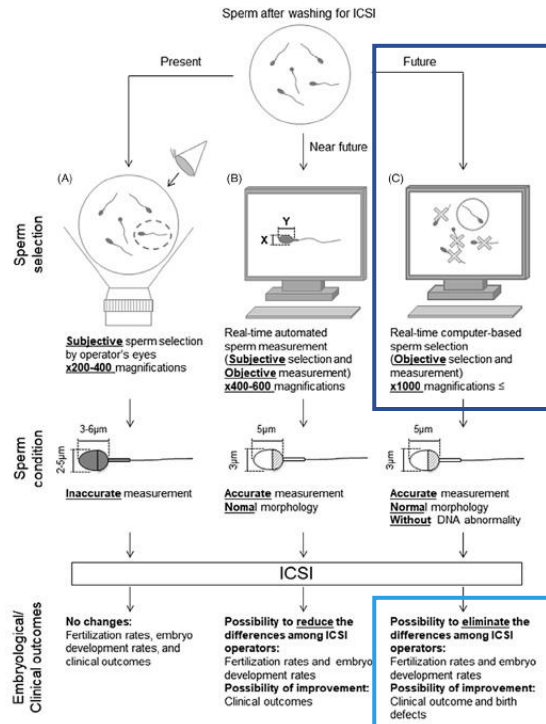

“ *This study demonstrates **the value of analyzing sperm morphology using the criteria recommended in terms of predicting fertilization and perhaps pregnancy outcome**... If the morphology is not evaluated with care, a diagnosis of unexplained infertility can be made incorrectly and lead to much frustration for both the patient and the physician.*

Kruger et al, 1987

Future

(C)

Real-time computer-based sperm selection (**Objective** selection and measurement) **x1000** magnification ≤

Possibility to eliminate the differences among ICSI operators:

Fertilization rates and embryo development rates

Possibility of improvement:

Clinical outcome and birth defects

Reoccurring revenue from disposable components

IVF is mainly a private market

- Most clinics are “for profit”
- For manual sperm selection couples currently pay ~ \$1,000 out-of-pocket
- Thus, BAIBYS’ product is mostly independent of reimbursement.
- The clinic’s costs for BAIBYS’ product are lower, allowing a higher margins and access to more customers

Capital

Disposables

Cost saving, fast, fully autonomous, objective, and accurate

- **Complete solution** – BAIBYS™ system is a complete and integrated solution
- **Time saving** – Fully autonomous procedure at high magnification in minutes
- **Low cost** – Reduced costs by saving long work of a highly qualified embryologists
- **Increasing lab throughput** – By shortening procedure overall time
- **Fully autonomous** – Objective technique, independent of human limitation such as subjective interpretation, fatigue, and distraction
- **State-of-the-art technology** – AI and robotic based revolutionary product
- **Latest development** – The newest high-tech tool for IVF centers that routinely perform ICSI
- **Achieves the ultimate goal** – Higher pregnancy rates while reducing major birth defects
