BAIBYS™

Select with care

IMPROVING IVF SUCCESS

Allowing fertility clinics to use only ideal sperm for IVF. Effortlessly.

Company Presentation

January 2025

www.7design.co.il

Vision & Mission

Vision

To harness cutting-edge technologies to allow more people to have healthy BAIBYS™.

Mission

To leverage artificial intelligence, big data, micro-robotics, and automation to improve male fertility by revolutionizing Assisted Reproductive Technology (ART).

One-Liner – Use Only Ideal Sperm for IVF

AI-based autonomous robotic system for selecting ideal sperm cells for IVF

BAIBYS™ develops an AI and robotics-based COMPLETELY AUTONOMOUS system for sperm selection at high magnification for ICSI (including the physical pickup and isolation of the ideal cells), which will **improve success rates**, **reduce birth defects**, and **raise clinics' throughput**. **Effortlessly**.

Fertility Crisis

Global Fertility Crisis Around Us

The New York Times

Opinion

What Are Sperm Telling Us?

Scientists are concerned by falling sperm counts and declining egg quality. Endocrine-disrupting chemica be the problem.

By Nicholas Kristof
Opinion Columnist

Feb. 20, 2

By Katherine Latham 28th March 2023

BBC

Sperm quality appears to be declining around the world but is a little discussed cause of infertility. Now scientists are narrowing in on what might be behind the problem.

BAIBYS™

Male Fertility Drops Dramatically

Sperm count

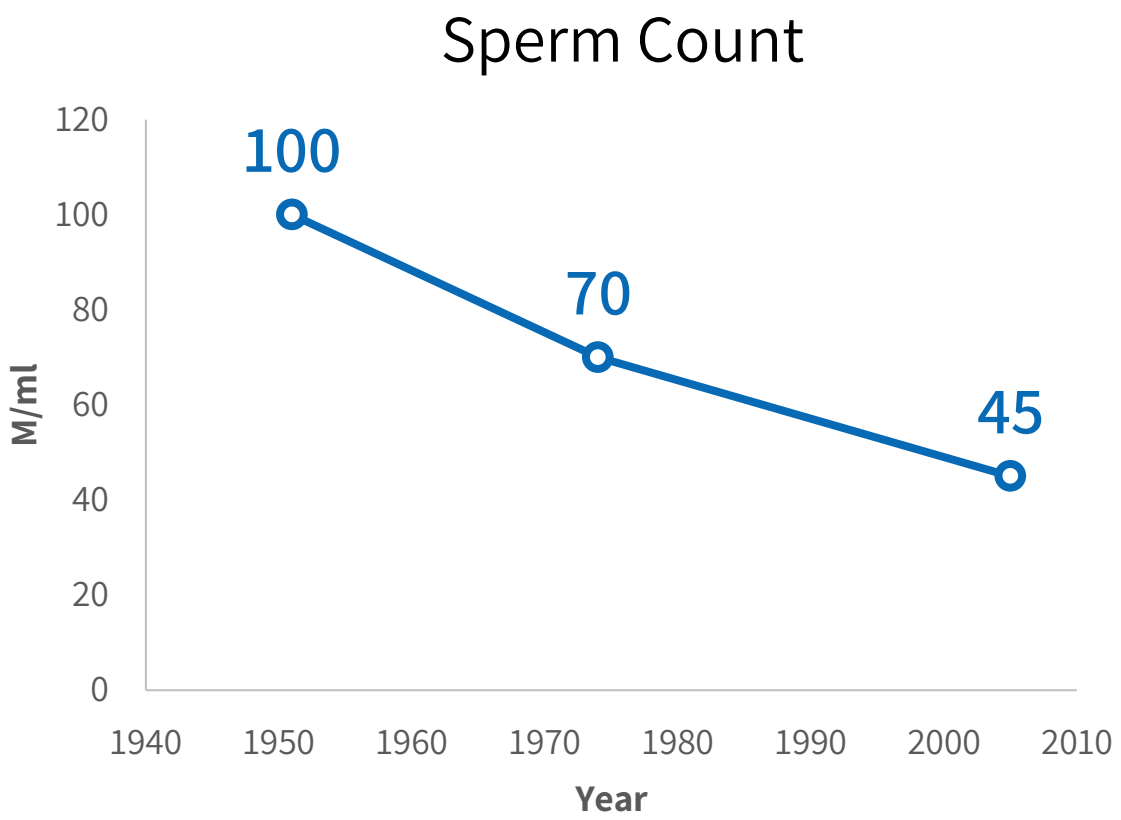
Decreased by 50% in 50 years and dropping

Sperm morphology

The criterion for “normal morphology” was changed since it became difficult to find “normal” based on the former definition –

Before 2010 – Definition of “normal sperm” was “>**14**% of cells have normal morphology” (WHO 4th Edition)

After 2010 – Definition of “normal sperm” changed to “>**4**% of cells have normal morphology” (WHO 5th Edition)



⇨ Male infertility accounts for ~50% of infertility cases

AIBYS™

Women Give Birth Later

IVF success declines with age

In 2016, the U.S. tipping point

More women gave birth in their 30's than their 20's.

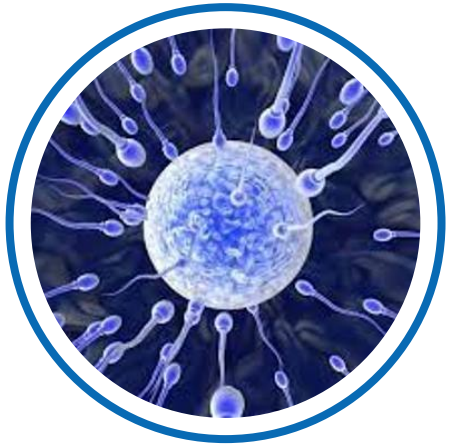
IVF Evolvement

Problem – Using Arbitrary Sperm for IVF



Classic IVF
Sperm cells compete to fertilize the egg – Natural selection

- ✓ Normal birth defects
- ✗ Low success rate

In ~73% of current IVF – Random sperm cell is injected into the egg (ICSI) to ensure penetration

- ✗ Higher birth defects
- ✓ Moderate success rate

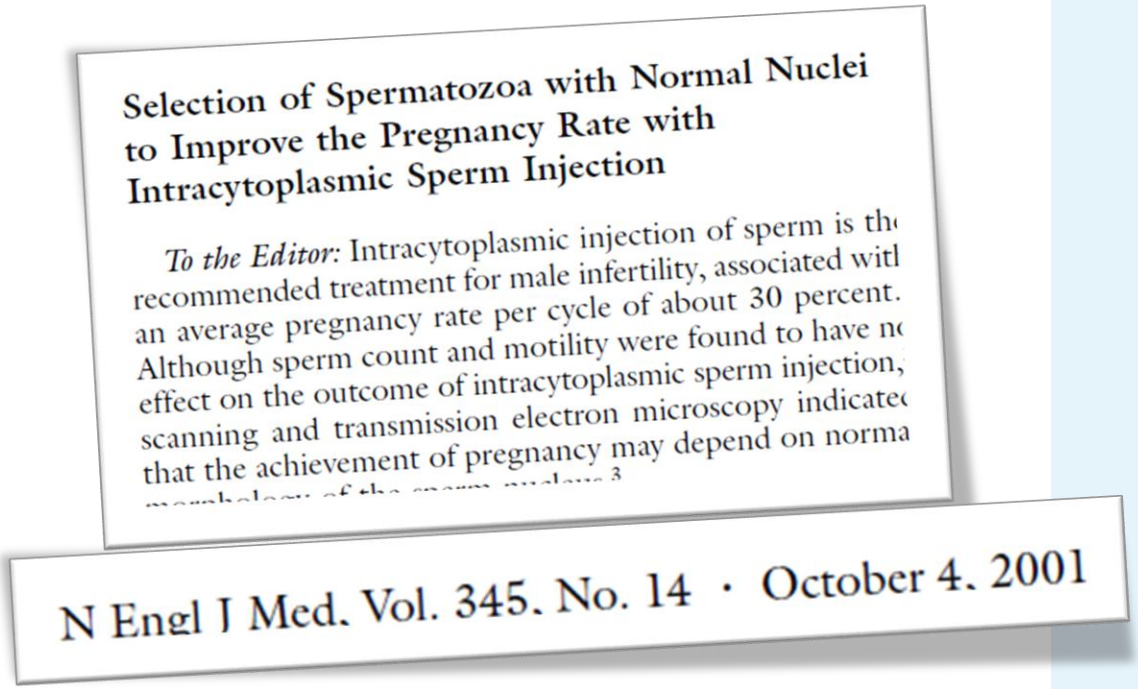
Sperm Selection at High Magnification – Detailed evaluation of sperm cell morphology and motility

- ✓ Normal birth defects
- ✓ Higher success rate

AIBYS™

Manual Sperm Selection at High Magnification

Trained embryologist **manually selects a single sperm** cell out of millions using a special microscope with **high magnification**.



Selection of Spermatozoa with Normal Nuclei to Improve the Pregnancy Rate with Intracytoplasmic Sperm Injection

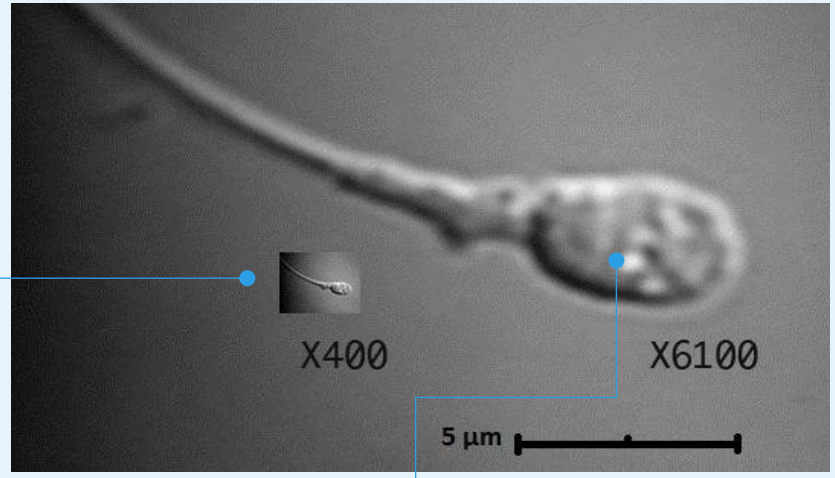
To the Editor: Intracytoplasmic injection of sperm is th recommended treatment for male infertility, associated witl an average pregnancy rate per cycle of about 30 percent. Although sperm count and motility were found to have nc effect on the outcome of intracytoplasmic sperm injection, scanning and transmission electron microscopy indicatec that the achievement of pregnancy may depend on norma

N Engl J Med. Vol. 345. No. 14 · October 4. 2001

AIBYS™

High Magnification Critical to See Moephology

Examining sperm cells at **high magnification shows morphological defects**, which correlate with low success rate and birth defects



At standard magnification no morphological details can be shown

At high magnification morphological defects are clearly shown

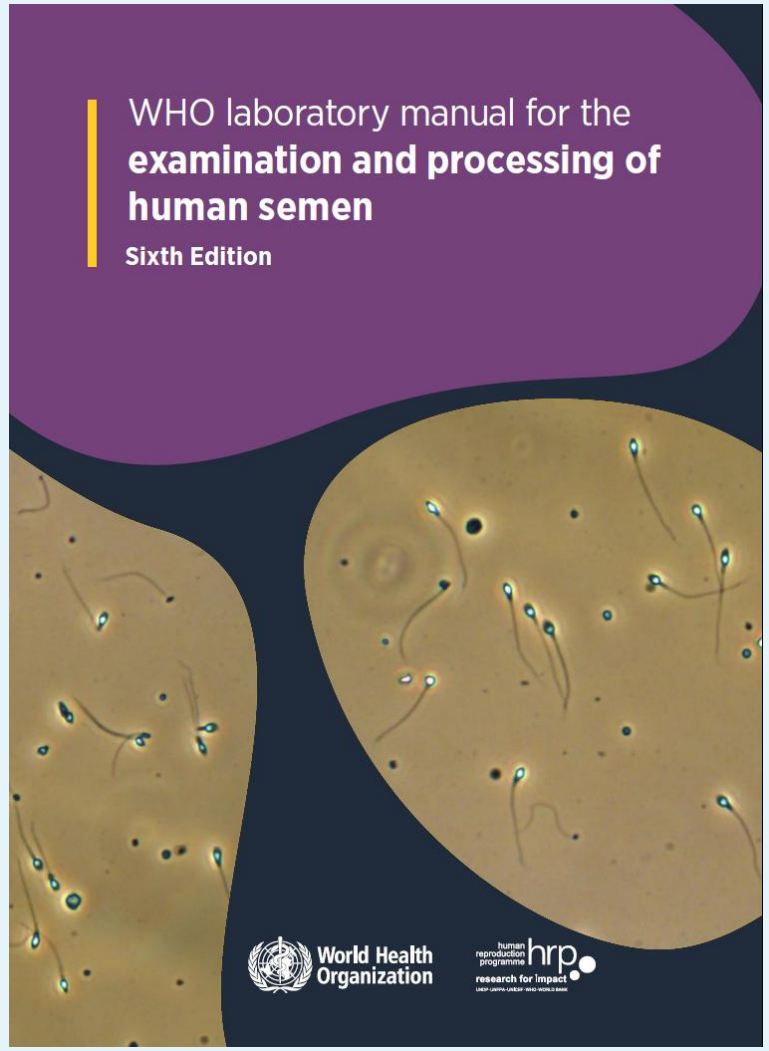
Higher IVF success rate & lower birth defects

AIBYS™

Morphology Correlated with Success Rate

WHO Guidelines (6th Edition, 2021)

"Abnormal spermatozoa generally have a **lower fertilizing potential**, depending on the types of anomalies, and may also have **abnormal DNA**. Morphological defects have been associated with **increased DNA fragmentation**, an **increased incidence of structural chromosomal aberrations**, **immature chromatin** and **aneuploidy**. Emphasis is therefore given to the form of the head, although the sperm tail (midpiece and principal piece) is also important to consider for the understanding of the male reproductive tract".



* WHO Laboratory Manual, 2021, page 49

AIBYS™

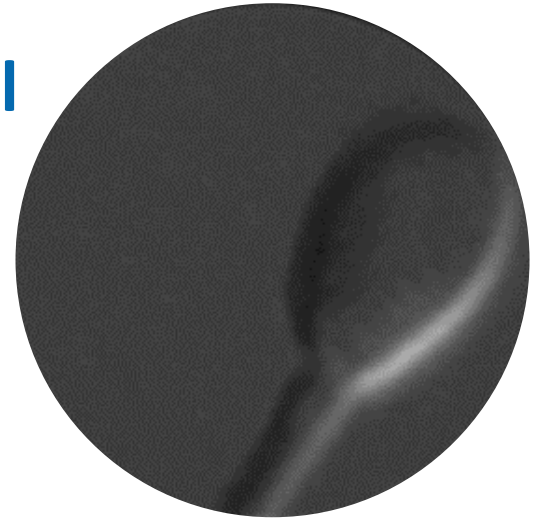
Benefits of Sperm Selection

- Higher fertilization rate
- Sperm quality is a critical factor for embryo development to blastocyst stage
- Higher pregnancy and birth rates
- Decrease birth defects
- The sperm cell delivers a novel epigenetic signature to the egg (Miller et al 2010)

Results According to Injected Sperm

Good sperm cell

Symmetric
Proportional
No morphology defects

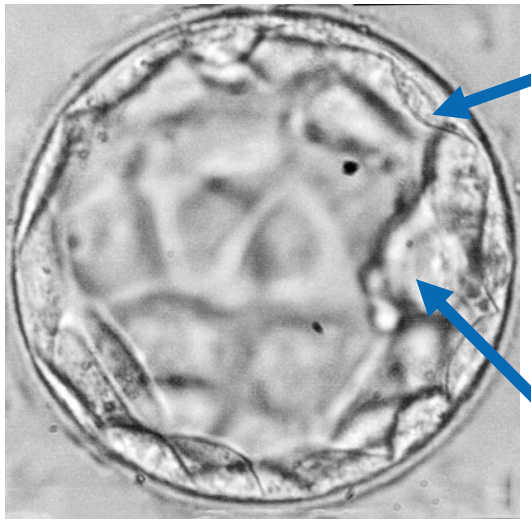


Bad sperm cell

Asymmetric
Non-proportional
Has morphological defects (vacuoles)

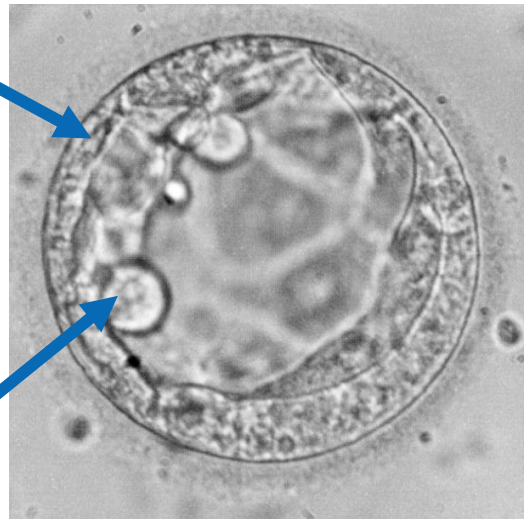
Good blastocyst

Embryo cells mass penetrates the blastocell cavity
Many placenta cells surround the blastocyst
Distinguished differentiation between them



Trophectoderm (TE) = Placenta cells

Inner Cell Mass (ICM) = Embryo cells



Bad blastocyst

Little to no embryo cells mass
Few placenta cells, most of them atretic

AIBYS™

Limitations of Manual Technology

Manual solution is limited

- Time consuming ~3h
- Subjective & inconsistent
- Requires extensive training
- Expensive

Not widely adopted

AIBYS™

BAIBYS' Solution

BAIBYS™ Solution Improves Success Rates

AI-based autonomous robotic sperm selection platform

- Fast
- Objective, consistent, & **more accurate**
- Fully automated
- Affordable

The smart future of IVF

CE

BAIBYS™

How Does It Work? AI Classification

AI classifies sperm cells morphology at high magnification

- **Proprietary algorithm processes** the video stream of “live” sperm in real time
- **Autonomously classifies sperm** cells based on their morphology & motility at high-magnification (×6,100)
- **The algorithm controls** the motorized X-Y stage in real time to maintain the selected sperm cell in the middle of the field of view to allow reviewing the cell from all sides

youtube.com/watch?v=cRwpi_0r4Tg

AIBYS™

How Does It Work? Robotic Selection

Robotic platform scans sperm and extract optimal cells autonomously

- Sub-micrometer motorized X-Y stage
- Intelligent Scanning Technology (IST)
- Controlled micro-manipulator
- Automated isolation of the selected sperm
- Controlled pump extracts cells
- Fully autonomous from A to Z

What Science Says (1)

> *Conclusions: IMSI* [a method of sperm selection at high magnification] *seems to be* ***an effective tool at reducing the incidence of structural defects*** *compared to ICSI…*
>
> Itoi et al, 2021

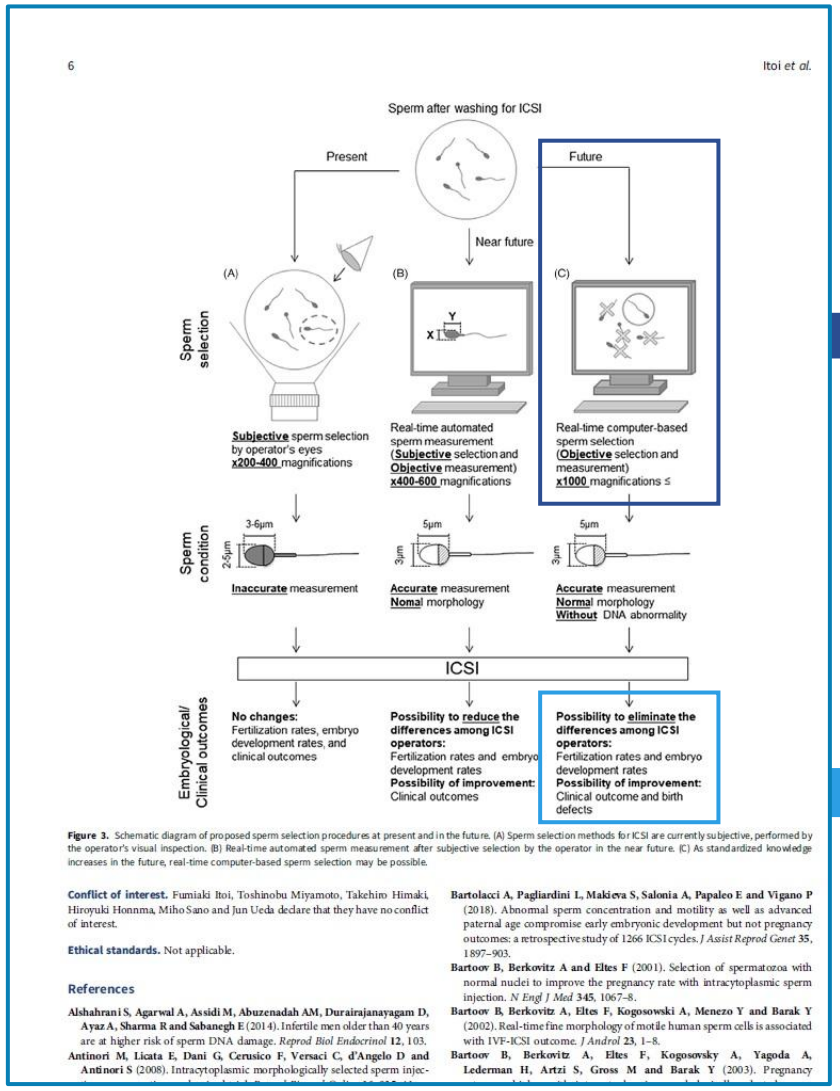
> *The* ***incidence of birth defects*** *was statistically different, with* ***2.5% (32/1280) in IMSI and 4.5% (119/2627) in ICSI****. The results demonstrated that IMSI decreased the incidence of structural defects compared to ICSI – 2.2% (18/830) vs. 3.8% (78/2049) – in a statistically significant manner.*
>
> Dieamant et al, 2021

> *We found a significant* ***differential DNA methylation and expression of many genes*** *in sperm with poor and good morphology.*
>
> Cassuto et al, 2021

> ***Tremendous opportunities exist for machine learning to advance male fertility treatments.*** *The fundamental challenge of sperm selection — selecting the most promising candidate from 100,000,000 gametes — presents a challenge that is uniquely well-suited to the high-throughput capabilities of machine learning algorithms paired with modern data processing capabilities.*
>
> You et al, 2021

> *This study demonstrates* ***the value of analyzing sperm morphology using the criteria recommended in terms of predicting fertilization and perhaps pregnancy outcome****… If the morphology is not evaluated with care, a diagnosis of unexplained infertility can be made incorrectly and lead to much frustration for both the patient and the physician.*
>
> Kruger et al, 1987

What Science Says (2)



6 Itoi et al.

Figure 3. Schematic diagram of proposed sperm selection procedures at present and in the future. (A) Sperm selection methods for ICSI are currently subjective, performed by the operator's visual inspection. (B) Real-time automated sperm measurement after subjective selection by the operator in the near future. (C) As standardized knowledge increases in the future, real-time computer-based sperm selection may be possible.

Conflict of interest. Fumiaki Itoi, Toshinobu Miyamoto, Takehiro Himaki, Hiroyuki Honnma, Miho Sano and Jun Ueda declare that they have no conflict of interest.

Ethical standards. Not applicable.

AIBYS™

Business Model

Reoccurring revenue from disposable components

IVF is mainly a private market

- Most clinics are “for profit”
- For manual sperm selection couples currently pay ~ $1,000 out-of-pocket
- Thus, BAIBYS’ product is mostly independent of reimbursement.
- The clinic’s costs for BAIBYS’ product are lower, allowing a higher margins and access to more customers

BAIBYS™

Product Benefits

Cost saving, fast, fully autonomous, objective, and accurate

- **Complete solution** – BAIBYS™ system is a complete and integrated solution
- **Time saving** – Fully autonomous procedure at high magnification in minutes
- **Low cost** – Reduced costs by saving long work of a highly qualified embryologists
- **Increasing lab throughput** – By shortening procedure overall time
- **Fully autonomous** – Objective technique, independent of human limitation such as subjective interpretation, fatigue, and distraction
- **State-of-the-art technology** – AI and robotic based revolutionary product
- **Latest development** – The newest high-tech tool for IVF centers that routinely perform ICSI
- **Achieves the ultimate goal** – Higher pregnancy rates while reducing major birth defects
